

SOP: Monthly SEO Technical Audits

Goal:

Build confidence and consistency in reviewing technical audits, prioritizing SEO work within client scope, and clearly communicating risks, quick wins, and larger opportunities.

This task supports core AM responsibilities around **technical SEO ownership, strategic prioritization, project management, and client communication.**

Step 1: Schedule Technical SEO Work

Before running or reviewing any audit, you must ensure technical SEO work is **planned and visible.**

What to Do

1. In the **client's Asana project**, create a dedicated **"Technical SEO"** section (if one does not already exist).
2. Add a recurring Monthly **"Technical SEO Review"** task:
3. Frequency should align to client scope
4. Duplicate & Schedule this task **out for the remainder of the client's contract:**
5. Every include a due date
6. No placeholder or unscheduled tasks

Expectation

1. Leadership should be able to open the Asana project and clearly see:
2. When technical SEO is reviewed
3. How often it happens in line with the scope for the client

4. That it is planned through the full contract term

Step 2: Run & Review SEMrush Site Audit

For the **current Technical SEO Review task**:

1. Run or refresh the SEMrush Site Audit so it is recent within 24h
2. Review Errors, Warnings, and Notices
3. Focus on issues that impact:
4. Crawlability & indexation
5. Rankings & visibility
6. Site performance & UX

Step 3: Prioritize Issues Within Client Scope

You are required to summarize technical issues from Semrush.

What to Do

1. Export the Issues Table in SEMrush

For the current Technical SEO Review:

1. Open the **SEMrush Site Audit**
2. Click into the **Issues** table
3. Click **Export** (top right)
4. For the report type, select **Issues**

This CSV export should include the following columns:

1. Issue ID
2. Issue Type (Error / Warning / Notice)
3. Issue Name
4. Failed Checks
5. Total Checks
6. Changed from Last Audit

2. Upload the Export to the Client's Technical SEO Tracking Sheet (new or existing)

1. One Google Sheet per client in their SEO client folder
2. One tab per month (e.g. Jan 2026)
3. Copy the export into that monthly tab
4. Do not modify or delete any of the exported columns

3. Classify and Summarize Each Issue

In the same tab, add the following columns to the right of the export:

1. Issue Category

(Crawlability, Indexation, Performance, On-page, Security, Content, Links, Other)

2. Impact Level

High / Medium / Low

3. Status as a drop down *(Required)*

4. Can Be Fixed (In Scope)
5. Requires Larger Effort
6. Low Impact
7. Not Relevant

8. Planned Action / Next Step

(Fix directly, schedule Asana task, flag to client as it is out of scope, monitor)

9. Asana Task Link

(If applicable)

10. Notes

(1–2 sentences max explaining the next steps)

AMs are classifying the **issue**, not every individual page.

4. Use SEMrush for Page-Level Details

1. If needed, click into an issue in SEMrush to view affected URLs (remember to focus on priority URLs, conversion points, service pages)
2. Page-level analysis stays inside SEMrush
3. The Google Sheet is for **summary, prioritization, and tracking over time**

Step 4: Schedule SEO Impact Check-Ins & Client Visibility

Any technical issue that becomes an **Asana task** must also include a **planned SEO impact review**.

This step is required for all completed technical fixes.

What to Do

1. Add Impact Check-In Subtasks

For each technical SEO fix that is completed:

1. Add **two subtasks** to the parent Asana task:
2. **SEO Impact Check — 3 weeks Update**
3. **SEO Impact Check — 6 weeks update**

2. Review SEO & CRO Impact

When completing each impact check-in:

1. Use **Looker Studio (CRO / SEO tracking views)** to review:
2. Page performance
3. Organic visibility signals
4. Engagement or conversion indicators (where applicable)
5. Compare performance **pre- vs post-fix** where possible
6. Note whether the change shows:
7. Positive impact
8. Neutral impact

9. Needs more time or iteration - schedule in a follow up subtask here for 2-3 weeks

3. Document the Outcome

In the subtask:

1. Add a short written update summarizing:
2. What was implemented
3. What changed (or didn't yet)
4. What the next step is (monitor, iterate, expand)

Keep this concise and client-safe.

4. Loop Into Client Reporting

Surface meaningful outcomes in the most appropriate client-facing touchpoint:

1. **Bi-weekly report** → if impact is quick or notable
2. **Monthly report** → if impact is broader or trend-based

This should clearly communicate:

1. What was done
2. Why it mattered
3. What impact we're seeing (or tracking)

What Success Looks Like

1. All issues are clearly categorized, prioritized, and assigned a status
2. In-scope issues are scheduled in Asana for that month, next steps and SEO impact is tracked and reported into the client in a timely manner.
3. Larger efforts and risks are clearly flagged
4. Month-over-month changes are visible via "Changed from Last Audit"
5. Anyone reviewing the sheet can quickly see:
6. What issues exist
7. What we're fixing

8. What we're flagging

9. What we're intentionally deprioritizing
